

Termination of pregnancy

[L] Medical termination of pregnancy after 24 weeks' gestation

NICE guideline <TBC>

Evidence reviews

April 2019

Draft for Consultation

*These evidence reviews were developed
by the National Guideline Alliance hosted
by the Royal College of Obstetricians and
Gynaecologists*

Disclaimer

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the [Welsh Government](#), [Scottish Government](#), and [Northern Ireland Executive](#). All NICE guidance is subject to regular review and may be updated or withdrawn.

1 Medical termination of pregnancy after 24

2 weeks' gestation

3 Review question

4 What is the optimal regimen for medical termination of pregnancy after 24 weeks' gestation?

5 Introduction

6 The aim of this review is to determine the optimal regimen and route of administration for
7 misoprostol (after mifepristone) after 24⁺⁰ weeks' gestation for women having a medical
8 termination of pregnancy.

9 Summary of the protocol

10 See Table 1 for a summary of the population, intervention, comparison and outcome (PICO)
11 characteristics of this review.

12 **Table 1: Summary of the protocol (PICO table)**

Population	Women who are having a medical termination of pregnancy after 24 ⁺⁰ weeks' gestation and received both mifepristone and misoprostol
Intervention	<p>Route of misoprostol administration:</p> <ul style="list-style-type: none"> • Vaginal • Sublingual • Buccal <p>Dose of misoprostol</p> <ul style="list-style-type: none"> • 100 micrograms (mcg) • 200 mcg • 400 mcg • 600 mcg • 800 mcg <p>Dose interval (both interval between mifepristone and misoprostol [simultaneous, delayed] and interval between subsequent doses of misoprostol)</p>
Comparison	All routes of administration, doses, number of doses, and dosing intervals listed above will be compared.
Outcome	<p>Critical outcomes:</p> <ul style="list-style-type: none"> • Failure to pass any products of conception • Uterine rupture • Incomplete abortion with the need for surgical intervention <p>Important outcomes:</p> <ul style="list-style-type: none"> • Time to expulsion (induction-to-abortion interval) • Diarrhoea • Haemorrhage requiring transfusion or ≥500 ml of blood loss

- Infection reported within 1 month of termination

1 *mcg: micrograms*

2 For further details see the full review protocol in appendix A.

3 **Clinical evidence**

4 **Included studies**

5 A systematic review of the clinical literature was conducted but no studies were identified
6 which were applicable to this review question. This was also the case when no limit was
7 applied to the minimum number of women in each intervention group.

8 See the literature search strategy in appendix B and study selection flow chart in appendix C.

9 **Excluded studies**

10 Studies not included in this review with reasons for their exclusions are provided in appendix
11 K.

12 **Summary of clinical studies included in the evidence review**

13 No studies were identified which were applicable to this review question (and so there are no
14 evidence tables in Appendix D). No meta-analysis was undertaken for this review (and so
15 there are no forest plots in Appendix E).

16 **Quality assessment of clinical studies included in the evidence review**

17 No studies were identified which were applicable to this review question.

18 **Economic evidence**

19 **Included studies**

20 A systematic review of the economic literature was conducted but no economic studies were
21 identified which were applicable to this review question.

22 A single economic search was undertaken for all topics included in the scope of this
23 guideline. Please see supplementary material 2 for details.

24 **Excluded studies**

25 No full-text copies of articles were requested for this review and so there is no excluded
26 studies list.

27 **Economic model**

28 No economic modelling was undertaken for this review because the committee agreed that
29 other topics were higher priorities for economic evaluation.

1 Resource impact

2 Table 2: Units costs associated with medical termination of pregnancy

Resource	Unit costs	Source
Repeat misoprostol 7 microgram per 1 hour	£93.00 per unit	BNF 75

3

4 Evidence statements

5 No evidence was identified which was applicable to this review question.

6 The committee's discussion of the evidence

7 Interpreting the evidence

8 *The outcomes that matter most*

9 One of the aims of medical termination of pregnancy is to pass the products of conception,
10 and hence failure to pass any products of conception was considered as a critical outcome.
11 The committee discussed that although uterine rupture is rare, it has very serious
12 implications for the woman, hence it was considered as one of the critical outcomes.
13 Incomplete abortion leading to the need for a surgical intervention can have implications for
14 the woman and resources, hence it was included as a critical outcome.

15 Time to expulsion (induction-to-abortion interval) may differ with different regimens and can
16 affect the acceptability of the regimen; hence it was included as an important outcome.
17 Haemorrhage requiring transfusion or ≥ 500 ml of blood loss can be a serious complication of
18 termination of pregnancy, and was therefore listed as one of the important outcomes.
19 Diarrhoea during the procedure and infection within 1 month of the procedure are adverse
20 events which may differ with different regimens, and hence were included as important
21 outcomes. Patient satisfaction, although an outcome of interest for this group was not
22 included in the review as other outcomes were prioritised, which were considered to be more
23 relevant to this review question.

24 *The quality of the evidence*

25 No evidence was identified about the optimal regimen for medical termination of pregnancy
26 after 24 weeks' gestation.

27 *Benefits and harms*

28 The committee noted, based on their knowledge and clinical experience, that there is
29 concern of increased uterine rupture in women having a medical termination of pregnancy
30 after a previous caesarean section. Also that there can be spontaneous uterine rupture
31 resulting from the use of prostaglandins after 24 weeks' gestation. As a consequence, a
32 more cautious approach towards medical termination after 24 weeks' gestation is often used,
33 with a lower dose of prostaglandin being given. However the committee were aware that
34 there is no evidence that lowering the dose of misoprostol is safer and that doing so may
35 prolong the procedure for the woman and increase the failure rate.

36 The committee considered that when recommending the dose of misoprostol to use, it was
37 important to get a balance between a dose which was too high, and therefore had the
38 potential to cause uterine rupture, and a dose which was too low and would result in the

procedure lasting longer and possibly failing. They agreed that in the absence of any direct evidence it would be appropriate to base the dose on evidence for the optimal regimen for medical termination up to 24 weeks' gestation for women between 24⁺⁰ and 25⁺⁰ weeks' gestation. Using clinical experience and expertise, the committee agreed that the uterus is more sensitive to misoprostol with gestational age, and hence the initial loading dose of misoprostol used in the regimen for medical termination up to 24 weeks' gestation would not be needed for the regimen for women between 24⁺⁰ to and 25⁺⁰ weeks'.

Based on their knowledge and expertise, the committee agreed that the uterus becomes more sensitive to misoprostol with gestational age, and hence a lower dose misoprostol regimen would be needed for women with a gestational age beyond 24 weeks. The committee also noted that the recommended dose reductions in misoprostol would be in line with the international guidance from FIGO for this group (Morris 2017).

Based on their knowledge and experience, the committee agreed that women with a history of previous caesarean section or uterine surgery may be at higher risk of uterine rupture with increased doses of misoprostol as the uterus becomes more sensitive to misoprostol as gestation advances. Hence they agreed that further research regarding the efficacy of drug regimens for this subgroup will be beneficial to inform future practice. Therefore the committee made a research recommendation for efficacy of drug regimens for medical termination of pregnancy in this group (see Appendix L). The committee noted that a subgroup of the women with a history of previous caesarean section or uterine surgery needed to be prioritised for research considering the higher risk for this group, and hence instead of recommending research for the whole group, focussed on them.

23 Cost effectiveness and resource use

A systematic review of the economic literature was conducted but no relevant studies were identified which were applicable to this review question and no economic analysis was conducted. Whilst the recommendations are likely to result in a standardised dose of misoprostol being used for medical terminations of pregnancy after 24 weeks, this is not likely to have a significant resource impact because of the small number of women having this procedure. Any net effect is likely to be cost saving with effective standardised drug regimens needing fewer surgical interventions.

31 Other considerations

The committee were aware of guidelines from the Royal College of Obstetricians and Gynaecologists that recommend feticide is used for medical termination of pregnancy after 21⁺⁶ weeks' gestation, unless the termination is being conducted for lethal fetal anomaly or the woman does not wish feticide (RCOG 2010).

The evidence considered for this review question covered the gestational age range after 24⁺⁰ weeks' gestation. However, recommendations were made for women after 23⁺⁶ weeks' gestation to be consistent with the requirements of the 1967 Abortion Act.

1 Appendices

2 Appendix A - Review protocol

3 Review protocol for review question: What is the optimal regimen for 4 medical termination of pregnancy after 24 weeks' gestation?

Field (based on PRISMA-P)	Content
Review question in SCOPE	What is the optimal regimen for termination of pregnancy after 24 weeks, for example, for fetal anomaly?
Review question in guideline	What is the optimal regimen for medical termination of pregnancy after 24 weeks' gestation?
Type of review question	Intervention
Objective of the review	To determine the optimal regimen and route of administration for misoprostol (after mifepristone) after 24+0 weeks' gestation
Eligibility criteria – population	<p>Women who are having a medical termination of pregnancy after 24+0 weeks' gestation and received both mifepristone and misoprostol</p> <p>Exclusions:</p> <ul style="list-style-type: none"> - Any studies with an indirect population
Eligibility criteria – intervention(s)	<p>Route of misoprostol administration:</p> <ul style="list-style-type: none"> • Vaginal • Sublingual • Buccal <p>Dose of misoprostol:</p> <ul style="list-style-type: none"> • 100 mcg • 200 mcg • 400 mcg • 600 mcg • 800 mcg <p>Dose interval (both interval between mifepristone and misoprostol [simultaneous, delayed] and interval between subsequent doses of misoprostol)</p>
Eligibility criteria – comparator(s)/control	1. All routes of administration, doses, number of doses, and dosing intervals listed above will be compared.
Outcomes and prioritisation	<p>Critical outcomes:</p> <ul style="list-style-type: none"> • Failure to pass any products of conception • Uterine rupture • Incomplete abortion with the need for surgical intervention <p>Important outcomes:</p> <ul style="list-style-type: none"> • Time to expulsion (Induction to abortion interval) • Diarrhoea • Haemorrhage requiring transfusion or ≥500ml of blood loss • Infection reported within 1 month of termination

Field (based on PRISMA-P)	Content
Eligibility criteria – study design	<ul style="list-style-type: none"> - Systematic reviews of RCTs - RCTs - If insufficient RCTs: comparative prospective cohort studies with $n \geq 50$ per arm - If insufficient comparative prospective cohort studies: comparative retrospective cohort studies with $n \geq 50$ per arm
Other inclusion exclusion criteria	<p>Inclusion:</p> <ul style="list-style-type: none"> - English-language
Proposed sensitivity/sub-group analysis, or meta-regression	<p>Stratified analyses based on the following sub-groups of women, where possible:</p> <p>Medical conditions:</p> <ul style="list-style-type: none"> - Complex pre-existing medical conditions - No complex pre-existing medical conditions <p>Caesarean section or hysterotomy:</p> <ul style="list-style-type: none"> - Previous caesarean section and/or hysterotomy - No previous caesarean section or hysterotomy <p>Feticide:</p> <ul style="list-style-type: none"> - Feticide administered - No feticide administered
Selection process – duplicate screening/selection/analysis	<p>Dual weeding will not be performed for this question</p> <p>Sifting, data extraction, appraisal of methodological quality and GRADE assessment will be performed by the systematic reviewer.</p> <p>Quality control will be performed by the senior systematic reviewer.</p> <p>Dual data extraction will not be performed for this question.</p>
Data management (software)	<p>Pairwise meta-analyses will be performed using Cochrane Review Manager (RevMan5).</p> <p>'GRADEpro' will be used to assess the quality of evidence for each outcome.</p> <p>NGA STAR software will be used for study sifting, data extraction, recording quality assessment using checklists and generating bibliographies/citations,</p>
Information sources – databases and dates	<p>Sources to be searched: Medline, Medline In-Process, CCTR, CDSR, DARE, HTA, Embase</p> <p>Limits (e.g. date, study design):</p> <p>Apply standard animal/non-English language exclusion</p> <p>Dates: from 1985</p> <p>Only studies conducted from 1985 onwards will be considered for this review question, as mifepristone was made available in the UK in 1991 and evidence to support the use of mifepristone in practice is unlikely to be more than 5 years before its licensing in 1991.</p>
Identify if an update	Not an update
Author contacts	For details please see the guideline in development web site.
Highlight if amendment to previous protocol	For details please see section 4.5 of Developing NICE guidelines: the manual

Field (based on PRISMA-P)	Content
Search strategy – for one database	For details please see appendix B
Data collection process – forms/duplicate	A standardised evidence table format will be used, and published as appendix D (clinical evidence tables) or H (economic evidence tables).
Data items – define all variables to be collected	For details please see evidence tables in appendix D (clinical evidence tables) or H (economic evidence tables).
Methods for assessing bias at outcome/study level	<p>Standard study checklists will be used to critically appraise individual studies. For details please see section 6.2 of Developing NICE guidelines: the manual</p> <p>Appraisal of methodological quality:</p> <p>The methodological quality of each study will be assessed using an appropriate checklist:</p> <ul style="list-style-type: none"> • RoBIS for systematic reviews • Cochrane risk of bias tool for RCTs • Newcastle-Ottawa scale for non-randomised studies <p>The risk of bias across all available evidence will be evaluated for each outcome using an adaptation of the 'Grading of Recommendations Assessment, Development and Evaluation (GRADE) toolbox' developed by the international GRADE working group http://www.gradeworkinggroup.org/</p>
Criteria for quantitative synthesis (where suitable)	For details please see section 6.4 of Developing NICE guidelines: the manual
Methods for analysis – combining studies and exploring (in)consistency	<p>Synthesis of data:</p> <p>Pairwise meta-analysis will be conducted where appropriate for all outcomes.</p> <p>When meta-analysing continuous data, change scores will be pooled in preference to final scores.</p> <p>For details regarding inconsistency, please see the methods chapter</p> <p>Minimally important differences:</p> <ul style="list-style-type: none"> • 'Haemorrhage requiring transfusion or >500 loss': Statistical significance • 'Uterine rupture': Statistical significance • 'Failure ((i.e. failure to pass any products)': Statistical significance <p>All other outcomes default values will be used of: 0.8 and 1.25 for relative risks which will be calculated for all dichotomous outcomes; 0.5 times SD (of the control group) for continuous outcomes</p>
Meta-bias assessment – publication bias, selective reporting bias	<p>For details please see section 6.2 of Developing NICE guidelines: the manual.</p> <p>If sufficient relevant RCT evidence is available, publication bias will be explored using RevMan software to examine funnel plots.</p>
Assessment of confidence in cumulative evidence	For details please see sections 6.4 and 9.1 of Developing NICE guidelines: the manual
Rationale/context – Current management	For details please see the introduction to the evidence review.
Describe contributions of authors and guarantor	A multidisciplinary committee developed the guideline. The committee was convened by The National

Field (based on PRISMA-P)	Content
	Guideline Alliance and chaired by Professor Iain Cameron in line with section 3 of Developing NICE guidelines: the manual. Staff from The National Guideline Alliance will undertake systematic literature searches, appraise the evidence, conduct meta-analysis and cost-effectiveness analysis where appropriate, and draft the guideline in collaboration with the committee. For details please see the methods chapter.
Sources of funding/support	The National Guideline Alliance is funded by NICE and hosted by the Royal College of Obstetricians and Gynaecologists

Appendix B - Literature search strategies

Literature search strategy for review question: What is the optimal regimen for medical termination of pregnancy after 24 weeks' gestation?

The search for this topic was last run on 3rd May 2018. It was decided not to undertake a re-run for this topic in November 2018 as this is not a fast moving evidence base and there were unlikely to be any new studies published which would affect the recommendations.

No economic evidence was identified which was applicable to this review question.

Appendix H - Economic evidence tables

Economic evidence tables for review question: What is the optimal regimen for medical termination of pregnancy after 24 weeks' gestation?

No economic evidence was identified which was applicable to this review question.

Appendix I - Economic evidence profiles

Economic evidence profiles for review question: What is the optimal regimen for medical termination of pregnancy after 24 weeks' gestation?

No economic evidence was identified which was applicable to this review question.

Appendix J - Economic analysis

Economic analysis for review question: What is the optimal regimen for medical termination of pregnancy after 24 weeks' gestation?

No economic analysis was conducted for this review question.

Appendix K - Excluded studies

Excluded studies for review question: What is the optimal regimen for medical termination of pregnancy after 24 weeks' gestation?

Clinical studies

Appendix L - Research recommendations

Research recommendations for review question: What is the optimal regimen for medical termination of pregnancy after 24 weeks' gestation?

What is the effectiveness and safety of regimens using mifepristone and misoprostol for women who are having medical termination of pregnancy after 23⁺⁶ weeks' gestation and have had a previous caesarean section or uterine surgery?

Why this is important?

There is lack of evidence regarding the optimal regimen for women undergoing medical termination of pregnancy after 24 weeks' gestation. Optimal regimens for women with a history of previous caesarean section or uterine surgery are of particular interest as they may be at higher risk of uterine rupture with increased doses of misoprostol as the uterus becomes more sensitive to misoprostol as gestation advances. Further research regarding the efficacy of drug regimens for this subgroup is needed to address the clinical uncertainty around the risks and inform future practice.

Table 3: Research recommendation rationale

Research question	What is the effectiveness and safety of regimens using mifepristone and misoprostol for women who are having having medical termination of pregnancy after 23 ⁺⁶ weeks' gestation and have had previous caesarean section or uterine surgery?
Importance to 'patients' or the population	A safe and effective regimen for termination of pregnancy will reduce failure rates, increase patient acceptability and reduce complication rates
Relevance to NICE guidance	To address clinical uncertainty around the risks of medical termination of pregnancy using mifepristone and misoprostol after 24 weeks' gestation in women with history of prior caesarean section or uterine surgery
Relevance to the NHS	To determine the effectiveness and safety of current regimes for medical termination of pregnancy using mifepristone and misoprostol for medical termination of pregnancy after 24 weeks' gestation in women with history of prior caesarean section or uterine surgery
National priorities	A safe and effective regimen for termination of pregnancy in women with a history of prior caesarean section or uterine surgery will reduce uterine rupture, failure and haemorrhage, thus reducing morbidity among women undergoing medical termination of pregnancy after 24 weeks' gestation
Current evidence base	The relevant research has not been done
Equality	Applies to all women with a history of prior caesarean section or uterine surgery undergoing medical termination of pregnancy after 24 weeks' gestation

NHS: National Health Service; NICE: National Institute for Health and Care Excellence

Table 4: Research recommendation modified PICO table

Criterion	Explanation
Population	Women undergoing medical termination of pregnancy (TOP) after 24 weeks' gestation with history of prior caesarean section or uterine surgery.

Criterion	Explanation
Intervention	Medical termination of pregnancy with mifepristone or misoprostol (irrespective of dosage regime)
Comparator	None
Outcome	<ul style="list-style-type: none">• Failure rate (failure to pass products of conception) as determined at 24 and 48 hours after starting misoprostol• Uterine rupture• Haemorrhage• Acceptability
Study design	Prospective cohort study
Timeframe	12 months
Additional information	None

TOP: termination of pregnancy
